LRS Security Solutions

LRS Security Solutions is focused on delivering outstanding information technology solutions, products, and services to our customers. Our team is here to assist your organization with all security needs through our professional, managed and response services. We can assess your level of risk, help you design and implement a complete security solution, and even provide 24/7 security monitoring and alerting to keep you safe. Working with LRS security experts gives your organization access to specialized skill sets and an expanded security team to fill any gaps. LRS is dedicated to keeping your data and systems secure and working alongside you to design a security strategy for your business needs.

LRS Services Capabilities

LRS offers security solutions that address the vast challenges companies face today, helping them plan and prepare for tomorrow. Services and solutions are tailored to your individual business needs, ranging from policy development and incident response plans to Security Services that professionally manage security for you.

Professional Services

- Security Assessments
- Solution Design and Engineering
- Strategic Consulting
- Secure Coding, Automation, and DevSecOps Security

Managed Services

- SIEM (Security Information & Event Monitoring)
- Vulnerability Scanning & Assessment
- MDR (Managed Detection & Response)
- Networking & Networking Security

Response Services

- Digital Forensics
- Incident Response
- Threat Hunting

PROFESSIONAL SERVICES

Our experience. Your peace of mind.

The LRS Security Solutions Professional Services team helps you to maximize your investment in security solutions from start to finish, improving your network performance, accelerate adoption of new technologies, and increase the proficiency of your in-house staff. Our team of security experts has worked with internal IT and data security teams across a variety of industries, helping organizations understand the common errors, omissions, and misconfigurations that ultimately lead to incidents or breaches.

Professional Service Offerings:

Security Assessments: Our Assessment offerings consist of our Cyber Risk Analysis (CRA), Penetration Testing, Framework Alignment & Risk Assessments. Our CRA is a narrowly focused, proprietary, security engagement that consists of internal and external vulnerability scanning, AD security assessment, and boundary firewall security evaluation.

Solution Design & Engineering: LRS' security engineers can help build a security solution to address your specific needs as well as fit within your budget. Their expertise extends through numerous hardware and software vendors, across various types of products. These include but are not limited to firewall, IPS/IDS, EDR, DLP, etc.

Strategic Consulting: LRS's security experts provide guidance on issues such as risk management, policy development, user awareness and training, regulatory compliance, audit preparation etc., most commonly through our vCISO engagement. A tailored set of services can be developed for your specific needs, ensuring a right fit for you.

Secure Coding, Automation, and DevSecOps Security:
Our team can identify vulnerabilities in your code and engage with your team for custom development projects, help with security automation to reduce repetitive work and increase security agility. LRS developers and engineers have the expertise, tools and processes to help you build security into a mature DevOps practice or are at square one of creating your secure pipeline for code.

MANAGED SERVICES

Our knowledge. Your advantage.

At LRS, we focus on building relationships with our customers, understanding their pain points, and using that information to create managed services that provide customer value. Our technical teams have the skills, certifications, and knowledge necessary to expertly manage customer environments. These managed environments can be in the cloud, or on customer premises, and span a wide variety of technology offerings.

Managed Service Offerings:

Security Information & Event Monitoring: LRS Security Solutions co-managed SIEM solution is laser-focused on enterprise security as the primary value driver. The solution is a collection of tools that provide real-time incident monitoring, triage, and threat detection. Using real-time correlation and data log analysis tools, LRS co-managed SIEM as a service provides a centralized solution for automating security log information and threat detection.

Vulnerability Scanning & Assessment: Vulnerability scanning, evaluation of results, and prioritization of remediation is often difficult for security teams to manage. Our team can handle this mundane, yet critical, operation for your business. We will work with, or develop, your documented vulnerability management program and will provide you with the ability to focus your efforts on true remediation activities.

Managed Detection & Response: MDR is a service combines technology and human expertise to perform threat hunting, monitoring, and response. The main benefit of MDR is that it helps rapidly identify and limit the impact of threats without the need for additional staffing

Networking & Networking Security: We believe in security maturity through better utilization of existing tooling. We've helped customers realize the full potential of modern firewalls, NAC, network segmentation, and more. Where some see security as separate from networking, our team assesses, designs, implements, and manages everything from wireless to SD-WAN, believing that networking and security are permanently coupled.
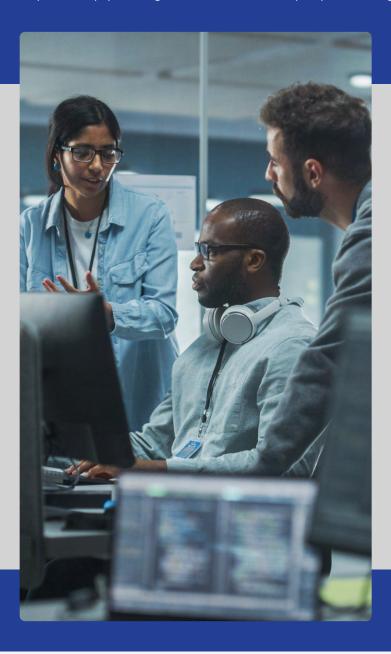

RESPONSE SERVICES

Don't be an easy target. Be well prepared.

Leveraging insights gained from hundreds of engagements each year, our Response Services team share knowledge about threat actor behaviors to inform and protect your business – enhancing best practices, guiding risk management decision making, and prioritizing resource allocation. We focus on identification, investigation, and remediation, utilizing three primary components.

With our Response Service, you gain experts who can help reduce incident response times, minimize breach impact, help your organization recover rapidly and mitigate further damage.

Response Service Offerings:

Digital Forensics: The operation of gathering, examining, and analyzing data from networks, applications, data stores, and endpoints, both on-premises and in the cloud to determine if an attack is in progress and who may be behind the activity.

Incident Response: Our Incident Response service provides security breach response, incident remediation, and forensics services. Our Incident Response services team can assist with forensics, cyber security risk mitigation, threat intelligence, threat hunting, and compliance efforts.

Threat Hunting: Our targeted Threat Hunting service is an intense comprehensive investigation of your security environment that identifies indications of attacker presence. This process validates security controls and reduces dwell time of an adversary in your environment.
